

Snap Bean Insect Pest Management - ECB management – SCRI Research Update

Wisconsin Crop
Management Conference
and Agri-Industry Showcase

WCMC

January 14, 2016

Madison, WI

Russell L. Groves¹, Brian A. Nault² &
Anders S. Huseth³

¹Department of Entomology, UW-Madison

²Department of Entomology Cornell University

³Department of Entomology, North Carolina State University

Outline

- Specialty Crops Research Initiative
- Results of 2012-2014 insecticide delivery trial
- 2014-15 ECB pheromone trap network
- Future directions and new risk assessment tools for ECB

SCRI-Snap bean insect pest management

Project Objectives

- Objective 1:** Identify consumer preferences and willingness to pay for sustainably produced and processed vegetables and quantify market segments
- Objective 2:** Create and test sustainability assessment tools and sustainability metrics for commercial vegetable growers
- Objective 3:** Validate and improve the relationship between practice-based sustainability assessments and environmental and economic outcomes at the farm scale in each region

Implement sustainable practices to identify opportunities for improved water, nitrogen, and pesticide use efficiency at the field and farm level (Bland, Colquhoun, Mitchell, Ruark)

Refine sustainable production practices to reduce environmental and economic risk
(Bland, Colquhuon, Hutchison, **Nault, Groves**, Ruark)

- Objective 4:** Build critical mass of support for sustainably grown and processed vegetables.

Diamides-a new reduced-risk material

IRAC - Insecticide Mode of Action Classification

Insecticide Resistance Action Committee www.irac-online.org

Nerve & Muscle Targets

Group 1 Acetylcholinesterase (AChE) inhibitors

- 1A Carbamates (e.g. malathion)
- 1B Organophosphates (e.g. chlorpyrifos)

Group 2 GABA-gated chloride channel antagonists

- 2A Cyclopyrene Organochlorines (e.g. endosulfan)
- 2B Phenylpyrazoles (e.g. fipronil)

Group 3 Sodium channel modulators

- 3A Pyrethrins, Pyrethroids (e.g. λ -cyhalothrin)

Group 4 Acetylcholine receptor (nAChR) agonists

- 4A Neonicotinoids (e.g. imidacloprid)
- 4C Butyltinolins (e.g. trifluorotolins)

Group 5 Nicotinic acetylcholine receptor channel agonists (allosteric)

- 5 Spirothiazes (e.g. spiromesifen)

Group 6 Chloride channel activators

- 6 Avermectins (e.g. abamectin)

Group 9 Non-specific mode of action (feeding blockers)

- 9B Pyriproxyfen
- 9C Flonicamid

Group 14 Nicotinic acetylcholine receptor channel blockers

- 14 Neonicotin analogs (e.g. Dorsapi)

Group 19 Octopamine receptor agonists

- 19 Amitraz

Group 22 Voltage dependent sodium channel blockers

- 22A Indoxacarb
- 22B Metathiazinone

Group 28 Ryanodine receptor modulators

- 28 Diamides (e.g. cyantranteroprol)

Growth & Development Targets

Group 7 Juvenile hormone mimics

- 7A Juvenile hormone analogues (e.g. imidacloprid)
- 7B Fenoxycarb
- 7C Pyriproxyfen

Group 10 Mite growth inhibitors

- 10A Clofentezene
- 10B Etoxazole

Group 15 Inhibitors of chitin biosynthesis, type 0

- 15 Bencoylureas (e.g. hexaflumuron)

Group 16 Inhibitors of chitin biosynthesis, type 1

- 16 Buprofezin

Group 18 Ecdysone agonists/molting disruptors

- 18 Diacylhydrazines (e.g. buprofezin)

Respiration Targets

Group 12 Inhibitors of mitochondrial ATP synthesis

- 12A Difenhydramides
- 12B Organotin miticides (e.g. cyflumetofen)
- 12C Propargite
- 12D Tetraolins

Group 13 Uncouplers of oxidative phosphorylation via disruption of H⁺ proton gradient

- 13 Chlorfenvinpyr

Group 20 Mitochondrial complex III electron transport inhibitors

- 20A Hydramethylnon
- 20B Acequinocyl
- 20C Fluscyprinat

Group 21 Mitochondrial complex I electron transport inhibitors

- 21A METI acaricides (e.g. tetrachlorpyrifos)

Group 23 Inhibitors of acetyl CoA carboxylase

- 23 Tactic and Tactic acid derivatives (e.g. spinetoram)

Group 25 Mitochondrial complex II electron transport inhibitors

- 25 Cyenopyrazin

Midgut Targets

Group 11 Microbial disruptors of insect midgut membranes

- 11A *Bacillus thuringiensis*
- 11B *Bacillus sphaericus*

Unknown

UN compounds of unknown or uncertain mode of action

- UN Azadirachtin
- UN Bitensazole
- UN Pyridalyl
- UN Pyridoxal

Adapted from: IRAC Group Meeting 2012, Photo: John Gorman

Diamides for pest management

- Mode of action: attacks the ryanodine receptors
- Insect stops feeding, becomes paralyzed and dies (<72h)
- Most effective through ingestion
- Exceptionally long residual control (14-21 days)
- Active against Lepidoptera, Coleoptera and Hemiptera
- Much less toxic to bees than neonics or pyrethroids

Exirel 10SE (cyazypyr):

- Anthranillic diamide (MoA group 28)
 - Use rate 13.5 – 20.5 fl. oz / ac (foliar)
 - Control of **Leps, Aphids, and PLH**
 - Application timing critical
 - Label anticipated for bean 2015 (?)

Coragen™ (rynaxypyr):

- Anthranillic diamide (MoA group 28)
 - Use rate 3.5 - 5 fl. oz / ac (foliar)
 - Control of **Leps**

SCRI-IPM project objectives (NY & WI)

1. Small-plot field trials

- Evaluate reduced-risk products (e.g. diamides) for insect control in bean
- Evaluate earlier application timings of reduced-risk products for ECB and PLH control
- Evaluate compatibility of diamide insecticides with either fungicides or herbicides for ECB and PLH control

2. Field-scale implementation trials

- Compare effectiveness of a new pest management program using reduced-risk products with the current approach
- Compare effectiveness of a new sustainable pest, disease and weed control program with the current approach

Conventional management program

Fungicide & insecticide tank mix

Herbicide & insecticide tank mix

2012, 2013 & 2014 small plot ECB trial

- RCBD (5 reps x 20 trts. + UTC)
- Three treatment windows:
 - pre-bud herbicides
 - early bloom fungicides
 - pin fungicides
- 2 insecticides – Brigade & Exirel 20SE (diamide) (13.5 & 20.5 fl oz./ac $\pm$ MSO)
- Herbicides: Reflex (fomesafen) + Basagran (bentazon)
- Fungicides: Topsin (thiophanate-methyl, Bravo (chlorothalonil)
- Infested with ECB neonates ($n \approx 2,500$ per plot)
- Planted: May 31, 2012, June 5, 2013 & June 3 2014
- Harvested: August 1, 2012, August 6, 2013 & 5 August 2014.

Results – Proportion pods damaged

- Average (mean percentage $\pm$ SE) *O. nubilalis* snap bean pod damage within each phenological application timing.
- Timing was significant in each year.
- Insecticide treatment main effect was significant in 2012 and 2013, but not 2014.
- Treatment by timing interactions were not significant in either year.

Means separation by treatment and timing - NY 2013

Plant damage

Pod damage

Means separation by treatment and timing – WI 2013

Phenological stage	Insecticide	Plant damage	Pod damage
untreated	-	18.5±5.2 a	8.7±2.5a
bud	bifenthrin (6.4 fl oz/ac)	9.0±6.4 b	2.6±1.2 bc
	chlorantraniliprole (5.0 fl oz/ac) (aka. rynaxypyr) - Coragen 1.67SC	4.1±3.3 bc	1.9±1.1 bc
	cyantraniliprole (10.2 fl oz/ac) (aka. cyazypyr) – Exirel 10OD	1.0±0.7 c	0.7±0.3 bc
	cyantraniliprole (13.5 fl oz/ac) (aka. cyazypyr) – Exirel 10 OD	0.8±0.5 c	0.6±0.2 c
bloom	bifenthrin (6.4 fl oz/ac)	0.7±0.4 c	1.4±0.4 bc
	chlorantraniliprole (5.0 fl oz/ac) (aka. rynaxypyr) - Coragen 1.67SC	0.0±0.0 c	0.0±0.0 c
	cyantraniliprole (10.2 fl oz/ac) (aka. cyazypyr) – Exirel 10OD	0.1±0.1 c	0.2±0.1 c
	cyantraniliprole (13.5 fl oz/ac) (aka. cyazypyr) – Exirel 10 OD	0.0±0.0 c	0.1±0.1 c
pod formation	bifenthrin (6.4 fl oz/ac)	0.0±0.0 c	0.0±0.0 c
	chlorantraniliprole (5.0 fl oz/ac) (aka. rynaxypyr) - Coragen 1.67SC	0.0±0.0 c	0.3±0.1 c
	cyantraniliprole (10.2 fl oz/ac) (aka. cyazypyr) – Exirel 10OD	0.0±0.0 c	0.0±0.0 c
	cyantraniliprole (13.5 fl oz/ac) (aka. cyazypyr) – Exirel 10 OD	0.0±0.0 c	0.0±0.0 c

Summary of Co-application studies – WI and NY

- Diamide insecticides (e.g. Coragen & Exirel) appear to have very good activity against ECB when applied as a foliar.
- Co-application of diamides with fungicides (bloom) had no antagonistic effects and were similar in performance to current foliar recommendations (pod-formation)
- Cyantraniliprole (aka. cyazypyr) was effective against ECB when applied as a in- furrow and as a liquid fertilizer pre-mix applications.

2013 & 2014 field implementation trial

- **8 conventional** fields paired with **8 novel** treatment fields planted between 6/24 & 7/23/2013 and 6/2 & 6/19/2014
- Collaborators: Seneca Foods, Nault, Dillard, & Kikkert
- cv. Huntington and Summit
- Livingston, Steuben and Yates counties
- Approximately 198 acres
- Commercial yields and ECB contaminants

Timing	Conventional trt. ^a	Novel trt. ^b	Pests/Diseases
At-plant	Cruiser + fung.	Cruiser + fung.	SCM, PLH, diseases
Early bloom (10-30%)	Topsin + Bifenture	Topsin @ threshold + Coragen	White mold & ECB
Late bloom (100%)	Bravo + Bifenture	Bravo + Coragen	White mold & ECB

^apre-emerge (Dual), first trifoliolate (Basagran & Reflex)

^bpre-emerge (none), first trifoliolate (Dual, Basagran, Reflex, Select Max)

2013 & 2014 paired field treatments

Results - 2013 & 2014 field implementation trial

2013 commercial trial results

- No ECB detected in crop in either study year.
- 2013 average marketable bean yield in bifenthrin treated fields was 9.5 ± 2.6 metric tonnes ha^{-1} in 2013 and 10.3 ± 2.2 metric tonnes ha^{-1} in 2014.
- Average marketable bean yield in chlorantraniliprole treated fields was 10.0 ± 3.7 metric tonnes ha^{-1} in 2013 and 11.4 ± 3.9 metric tonnes ha^{-1} in 2014.

If insects remain at low densities are insecticides always necessary?

Future directions: ECB population decline in NY

Pheromone trap locations 2008-2014

- Pheromone catch data
- Land cover data (NASS-CDL)
- Landscape-based risk model

Has Bt corn affected pest density in Western NY?

ECB trap data & corn production intensity

ECB landscape risk objective

Describe the influence of transgenic crop abundance on ECB abundance in alternate host crops

1. Abundance of ECB will decline with BT abundance* in the landscape that will result in an ecosystem service (*benefit*) to processing crops (A).
2. The abundance of pyrethroid treated sweet corn will provide a stable refugia from Bt and greater risk to processing crops in specific WNY agroecosystems (B).

*Assuming a high proportion of maize grown in WNY contains one or more Bt events that have lepidopteran activity

Estimating corn abundance in time

- Compile NASS Cropland Data Layers 2008-2013
- Reclassify crop types for each year (corn or not)
- Sum annual corn incidence
- Calculate spatiotemporal abundance from GIS output:

$$\text{Corn dominance metric} = \frac{\sum_{i=1}^j i \cdot T_i}{\sum_{i=1}^j T_i}$$

2011

2012

2013

2008 - 2013

Sampled locations 2014

- 40 sampled fields
- Maintained 20 high risk & 20 low traps
- ECB-E pheromone
- July – mid September (N=40 sites)

less

ECB risk

greater

Avon, NY – CDM score: 3.37

Dansville, NY – CDM score: 1.22

Date

Insecticides for Managing Snap Bean Pests

Recently Labeled in Wisconsin:

- Radiant SC (spinetoram)
- Coragen 1.67 SC (chlorantraniliprole) – foliar
- Blackhawk (spinosad) – foliar
- Beseige (chlorantraniliprole + lambda-cyhalothrin)
(aka. Voliam Xpress)
- Belt SC (flubendiamide) – foliar
- Entrust SC (spinosad) – foliar
- Movento (spirotetramat) – foliar (sap-feeding insects only)
- Transform WG (sulfoxaflor) – foliar (cancelled)

In the Pipeline or in Review:

- Exirel, Verimark (cyantraniliprole) – 2015/16

A wide-angle photograph of a large agricultural field, likely a vineyard or orchard, with rows of young green plants stretching towards the horizon under a clear blue sky. The perspective is from a low angle, looking down the rows of crops. The plants are small and green, with visible soil and mulch between the rows. In the distance, a line of trees and some structures are visible on the horizon.
