

The Role of Pioneer Farm in the Wisconsin Phosphorus Index

Chris Baxter
University of Wisconsin - Platteville

Location

5 miles south of
Platteville, WI.
Located in MLRA
105 – Northern
Mississippi Loess
Hills

Proposed Major Land Resource Areas Wisconsin

June 21, 2001

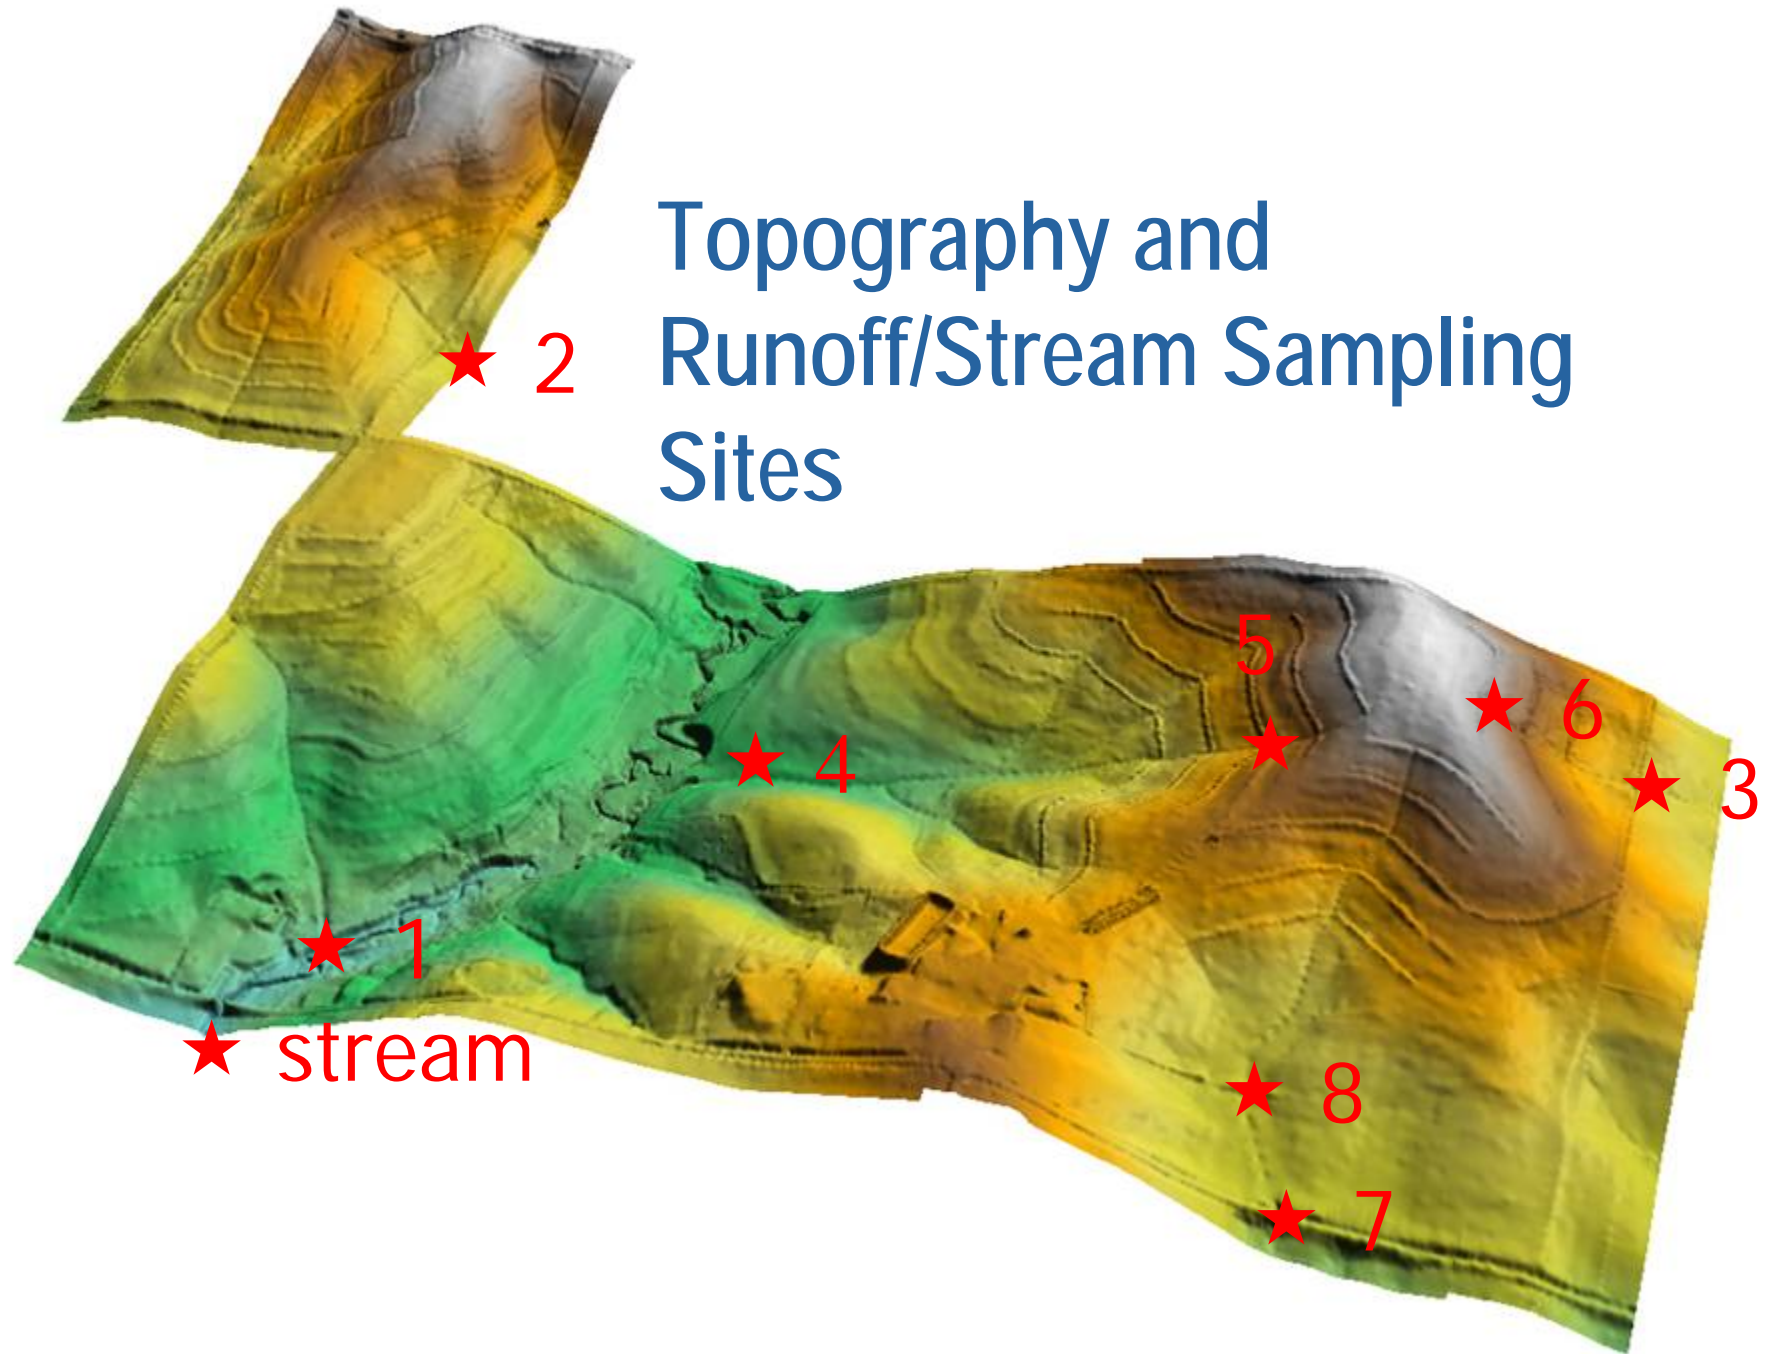

USDA - Natural Resources Conservation Service

Pioneer Farm Research Priorities

1. Baseline measurements:
environmental & farm management
2. Water quality:
soil conservation practices, erosion & sediment delivery
3. Nutrient management:
focus on N & P
4. Manure Management
composting, liquid/solid separation
5. Air quality
odor monitoring

**** Support of science-based public policies ****

Topography and Runoff/Stream Sampling Sites

Typical Pioneer Farm Runoff Monitoring Station

- Raingage
- Solar Panel
- Gaging station
- Shaft-encoder stage sensor
- Plywood wingwall

Sampling Equipment

Peristaltic sample pump

Datalogger and control unit

Stage sensor

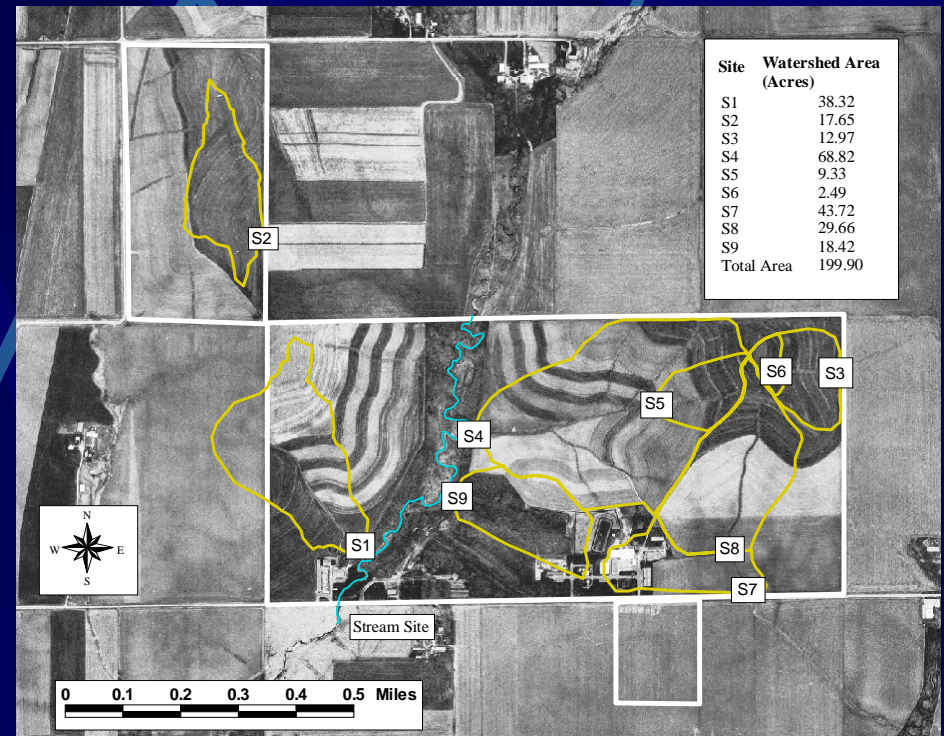

Battery

Refrigerated ISCO autosampler

Calibrating the P Index: Why use Pioneer Farm?

- Existing baseline data
- PI has been determined on all fields
- 4 Single-crop subwatersheds
- Management flexibility

Results of PI and Annual Loads

**** Provisional Data ****

Effect of Cropping System on Annual Sediment Load

Effect of Cropping System on Total P Load

Winter Manure Applications

2004 Winter Runoff – 3 events

Received winter manure

Ongoing Research: Testing the relationship between STP and runoff P losses

Small Plot Scale

Watershed Scale

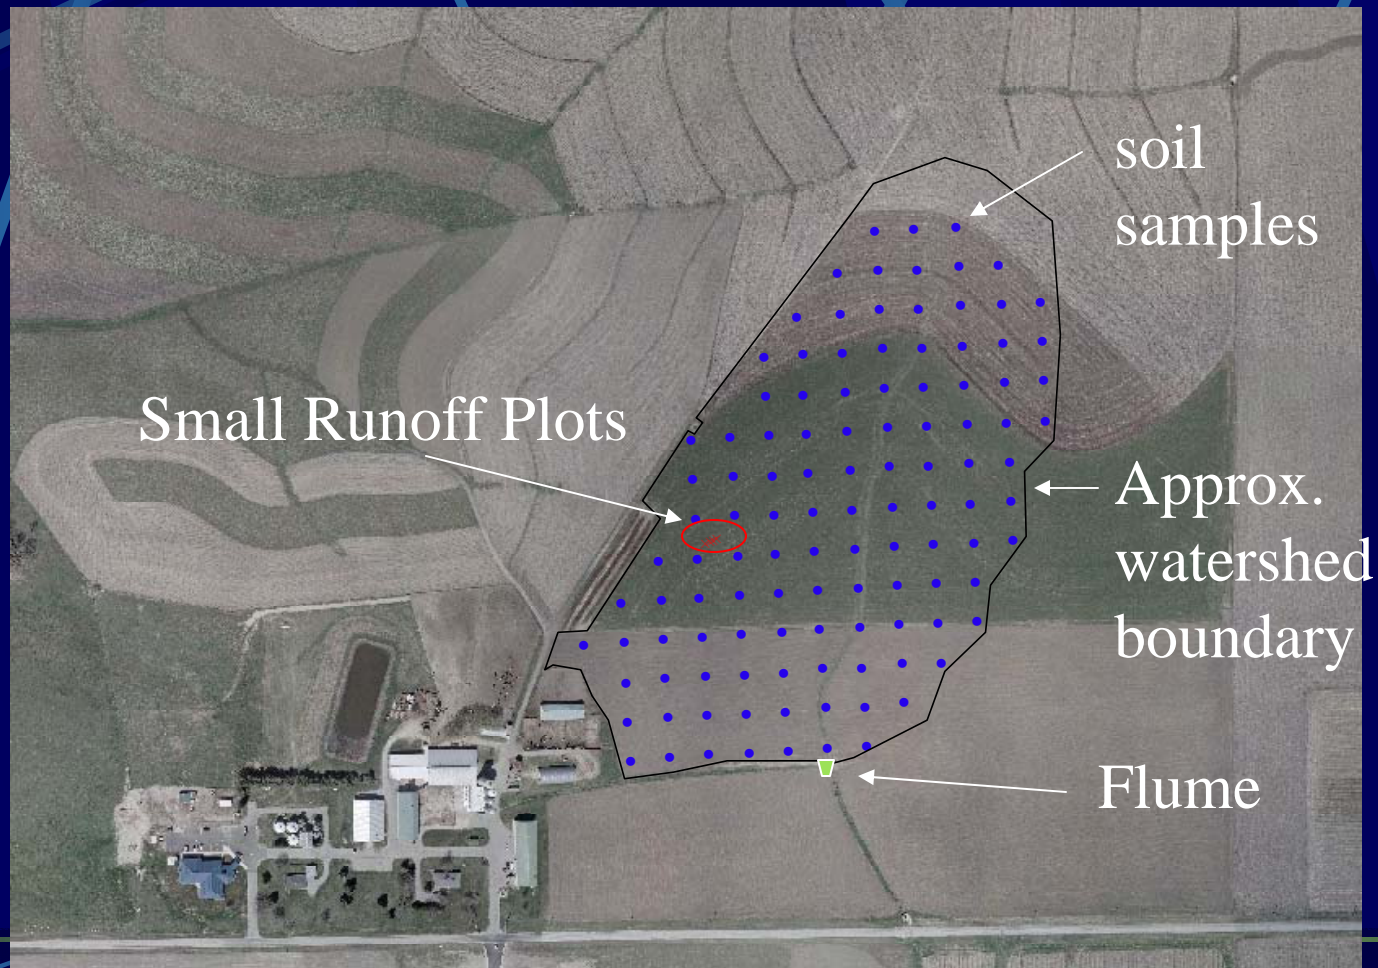

Simulated Runoff

Natural Runoff

Alfalfa watershed

Does runoff dissolved P change by season?

Season (2004 crop year)	Site 2 (1 st year corn)	Site 8 (1 st year hay)
	----- Average dissolved P concentration (mg/L) -----	
Fall (harvest- Nov. 15)	0.50 (n=4)	N/A
Winter (snowmelt and winter precipitation)	0.43 (n=20)	2.35 (n=23)
Spring (April 1 – June 1)	0.46 (n=13)	0.57 (n=6)
Summer (June 1 - harvest)	0.42 (n=8)	1.57 (n=2)

Bottom Line: Is the PI a better predictor of P losses than Soil Test P?

*** Provisional data and Site 2 – 2004 removed
